

Superconducting solar power generation for home use

Overview

What are the advantages of superconducting?

As well as being highly energy efficient and re-liable, superconducting systems are less dis-ruptive to install and require much less space than conventional cables and overhead lines. Moreover, their capacity to transmit power is enormous: a single cable can handle more than 3 GW – enough to power a large city. – particularly in urban power grids.

Do superconducting cables save energy?

Energy savings – superconducting cables are ultra-efficient conductors with zero or near-zero resistance. The power saving achieved in this way is greater than the energy expended to maintain conductors at a low temperature.

Are high-temperature superconducting cables suitable for power grids?

High-temperature superconducting cables have a number of technical and physical characteristics that make them strong candidates for applications in power grids. Minimal land take – rights of way for HTS cables are up to ten times narrower than those for conventional cables and lines.

What are the future applications of superconductivity?

There are visionary ideas for the future applications of superconductivity. One of them was to generate solar power in areas where it is abundant and transport it in an inter continental grid to areas where it is required. Since the sun shines somewhere on the earth at any given time, this grid would obviate the need for storing energy!.

What is a superconducting cable system?

Superconducting cable systems offer high-efficiency bulk power transmission over long distances, with none of the resistive losses encountered in conventional high-voltage lines and cables. High-voltage DC (HVDC) superconducting cable systems are particu-larly suited to this application.

What is a superconducting wire?

Compared to conventional copper wire, the upgraded superconducting wire can transfer electricity at 200 times the electrical current. It also provides ComEd the flexibility to reroute power around downed substations to shorten restoration times for customers.
